

Chart A illustrates the economic feasibility of oversizing a chamber, when viewed from a cost per filter cartridge perspective. The dirt holding capacity of a cartridge is increased if the flow rate through each cartridge is decreased. This, in

turn, reduces the number of filter cartridges required to handle a given dirt load and reduces the labor costs associated with filter cartridge replacement by increasing the time period between change outs.

* Based on average sizing [i.e. 1 x 10" (25 cm) cartridge per 50 gallons (189L)].

Example of savings based on Series 'G' chambers.
(Does not reflect savings due to reduction of downtime & solution loss.)

CHAMBER MODEL	TIME BETWEEN CARTRIDGE CHANGES	COST OF CARTS. USED PER YEAR ¹	COST OF LABOR FOR CHANGING CARTS. PER YEAR ²	YEARLY SAVINGS ³
CL120S-1½-G3A	4 Weeks	\$ 405.60	\$ 32.50	-
CL240S-1½-G3A	12 Weeks	270.40	10.80	\$ 156.90
CL360S-1½-G3A	20 Weeks	243.36	6.50	188.24

¹ Based on \$2.60 each.

² Labor based on \$10.00 per hour @ 15 minutes per change.

³ Compared to expenses on Model CL120S-1½-G3A

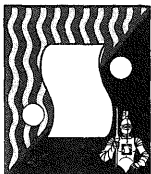

Increasing the size of your filter chamber is particularly worthwhile, since most filter chambers are offered in larger sizes at only a slight increase in cost.

... plus savings in time and prevention of solution loss.
